Assignment 0205 Feedback

Marc Mouallem

(this feedback is a "conversion" of the feedback from last year's assignment into this year's outcomes)

1a — You show good command line mastery in this assignment. (**+**)

1b — You worked with processes and memory usage well. (**+**)

1c — Your file activities look good, but did not use the right commands for determining disk usage nor mounted volumes, and you missed one last step in the inode exercise, thus omitting one of the main points that this was meant to make. (**/**)

1d — You showed good proficiency with managing I/O across the board. Your screenshots of `screen` show its use thanks to the window title, but still it would also have been good for you to show the commands that you used. (**|**)

1e — You have shown that you have no problems interacting with computers through normal `ssh`, but are missing the tunneling exercise. (**/**)

4d — You generally did a good job with looking up necessary information, although some of that was hampered either by a misunderstanding of the assignment question, or misunderstanding what some commands showed you (`du` and removable media exercises). (**|**)

4e — You had a single commit, which is marginally acceptable given the nature of the assignment. Your commit message could have been better though. (**|**)

4f — Submitted mostly on time, except for the `ssh` tunneling exercise. (**|**)
